QA Test for Kantox: Part I - exploratory testing.

Scope:	Spot order API execution
Duration:	40 min
Tools:	Postman
Endpoints:	GET https://demo.kantox.com/api/companies/TXSDPPJV9/bank_accounts/index
Problem description:	The referred documentation is on that link: https://demo.kantox.com/en/secure/api_docs#/bank_accounts/bank_accounts. - When nothing is found upon request, the HTTP status "200 OK" is returned together with the empty array. It could be possible to return the status "404" (but it is optional). - There is an error in the documentation since it says that the key should be called "bankCountryCode" whereas in the API it should be used as "countryCode". - The parameter called "accountAlias" in the documentation does not work in the HTTP, probably instead it's called "name" there. - Search by "accountNumber" does not work - returns an empty array with "200 OK" status. - "beneficiaryRef" from the documentation is not found. If it refers to the "kantoxReference", it does not work anyway since it returns an empty array. - It's possible to search by date ("createdStart", "createdEnd", "updatedStart", "updatedEnd"), but these fields are not present in the body response.
